1. Task Description

   Most software engineers do not like documentation. As lazy guys, we want to use some tools for **auto documentation**. Doxygen is a documentation generator and static analysis tool for source codes. It supports other popular programming languages such as C, C++, Objective-C, C#, PHP, Java, Python, IDL (Corba, Microsoft, and UNO/OpenOffice flavors), Fortran. This time, I want you to write down a small tutorial about how to use doxygen. You must use your own codes for any problems in **HW04** as an example and a Makefile for generating documents.
